TECHNICAL SKILLS

Languages: TypeScript/JavaScript, Python, Go, Rust, Kotlin, Java, SQL, HTML, CSS

Technologies: React, Node.js, FastAPI, REST APIs, WebSockets, PostgreSQL, MongoDB, SQLite, Docker

Tools & Platforms: Git, GitHub, GitLab, Linux, CI/CD, Pytest, Jest, JUnit, Jira

EXPERIENCE

Software Developer Intern

Jan 2025 – Aug 2025

1Password

Toronto, ON (Remote)

- Expanded guided setup to support business accounts, contributing across the stack (**TypeScript, Rust, Kotlin**) to improve onboarding flow in the browser extension, web app, and desktop app.
- Collaborated on the backend design of B2B guided setup, using **Unleash** for account-based feature flagging to roll changes out safely to production without disrupting existing users.
- Led the effort to restore admin policy support on the web client, identifying a blocker, aligning on security constraints, and implementing a **SQLite** based solution to unblock the feature.
- Contributed to a **Rust**-based autofill engine by diagnosing and resolving complex field-detection and saving issues, improving stability for thousands of users.
- Improved OPA (1Password Android) autofill setup success by **~10%** through improved onboarding instructions; impact confirmed via telemetry metrics.

Software Developer Intern

May 2024 – Dec 2024

KNS Canada Inc.

Toronto, ON

- Collaborated in an agile team to develop a fullstack application using a **React** front-end and a **Node.js** back-end, replacing an Excel-based system and **optimizing data retrieval time by 50%**.
- Designed and implemented a **PostgreSQL** database, replacing Excel to improve data consistency and efficiency.
- Ensured data uniformity by implementing strict data validation and constraints, reducing data inconsistencies and errors common in the previous Excel-based system by an estimated **30%**.
- Wrote unit and integration tests for the database API to ensure reliability and fault tolerance.

PROJECTS

Mira: Spotify Car Thing Firmware | *Go, TypeScript, React, On-Device ML, Rust, C*

- Built and open-sourced standalone firmware reviving the discontinued Spotify Car Thing, covered by **TechRadar**, **Android Authority**, and **BGR**, with **1,500+ downloads** and **75+ GitHub stars**.
- Built a real-time on-device speech pipeline: custom-trained wake word detection, endpointing, and streaming **Zipformer ASR** (int8 ONNX) on hardware with 512 MB of RAM, **~3.5s** end-to-end with no cloud round-trip.
- Built a Go backend and **React/TypeScript** frontend with real-time state streaming, API integrations, caching, validation, and user-facing error recovery.
- Integrated with undocumented upstream APIs, adding automatic recovery when endpoints changed without warning and resolving user-reported issues across hardware configurations I could not reproduce locally.

Veritas: Political Bias Detection and Fact Checking | *Python, PyTorch, FastAPI, TypeScript, React*

- Collaborated on a **React/TypeScript** Chrome extension and **FastAPI** backend that analyzed news articles and surfaced sentence-level bias and claim-verification results within the browsing experience.
- Built an inference pipeline with politicalness filtering, sliding-window context, and weighted aggregation, processing articles in an average of **2.7 seconds**.
- Evaluated the model across held-out and out-of-distribution data, achieving **82%** on held-out data and **61%** on unseen sources, a **14% improvement** over the baseline.

Halal Scanner Android App (Closed Beta on Google Play Store) | *Kotlin, Android SDK, SQLite*

- Built a **Kotlin** Android application integrating Google ML Kit barcode scanning with the Open Food Facts **REST API** to retrieve structured product data.
- Designed and implemented scanning, result, history, loading, and error states using Android platform patterns and persistent local storage.

EDUCATION

McMaster University

B.A.Sc Honours Computer Science Co-op

Hamilton, ON

April 2026
